

# Twisted forms of linear algebraic groups: Relative root subgroups

Sergei Haller

`Sergei.Haller@math.uni-giessen.de`

Magma Workshop on Group Theory and Algebraic Geometry

University of Warwick, Coventry, UK

August 22–26, 2005

# The Project

- Main goal: algorithms for computation in linear algebraic groups
- Joint with Arjeh M. Cohen, Scott H. Murray and Don E. Taylor
- Implementation in Magma

# Preliminary remarks

- Classification of finite simple groups
  - Chevalley groups (“untwisted”)
  - Twisted Chevalley groups (unitary, Ree, Suzuki, . . .)

# Preliminary remarks

- Classification of finite simple groups
  - Chevalley groups (“untwisted”)
  - Twisted Chevalley groups (unitary, Ree, Suzuki, . . .)
- Computation in “untwisted” groups possible for arbitrary fields
  - Steinberg presentation
  - Unique decomposition of elements

# Preliminary remarks

- Classification of finite simple groups
  - Chevalley groups (“untwisted”)
  - Twisted Chevalley groups (unitary, Ree, Suzuki, ...)
- Computation in “untwisted” groups possible for arbitrary fields
  - Steinberg presentation
  - Unique decomposition of elements
- Computation in “twisted” groups is not possible
- More twisted groups for arbitrary fields

# Linear Algebraic Groups

- $F$  is an algebraically closed field
- Linear algebraic groups are
  - subgroups of  $GL_n$  for some  $n$
  - defined by polynomial equations (over  $F$ )
- Examples:

$$GL_n = \{ (A, t) \in F^{n \times n+1} \mid \det(A)t = 1 \}$$

$$SL_n = \{ A \in F^{n \times n} \mid \det(A) = 1 \}$$

$$SU_n = (SL_n)_\alpha$$

# Field of Definition

- $F$  is an algebraically closed field
- $G$  is a linear algebraic group
- $G$  is defined over the subfield  $k \subseteq F$  if the polynomials involved in the definition of  $G$  are over  $k$
- Examples:  
 $GL_n$  and  $SL_n$  are defined over the prime field of  $F$

# Groups of Lie type

- For a Galois extension  $k \subseteq K \subseteq k_{sep}$  and  $\Gamma = \text{Gal}(k_{sep} : K)$

$$G(K) = \{ g \in G \mid g^\gamma = g \quad \forall \gamma \in \Gamma \}$$

(here  $\Gamma$  acts componentwise on the entries)

# Cocycles

- $A$  is a group,  
 $\Gamma$  is a group acting on  $A$  (on the right)

# Cocycles

- $A$  is a group,  
 $\Gamma$  is a group acting on  $A$  (on the right)
- A cocycle is a map  $\alpha : \Gamma \rightarrow A$ ,  $\alpha : \gamma \mapsto \alpha_\gamma$  s.t.

$$\alpha_{\sigma\tau} = (\alpha_\sigma)^\tau \cdot \alpha_\tau \quad \forall \sigma, \tau \in \Gamma$$

# Cocycles

- $A$  is a group,  
 $\Gamma$  is a group acting on  $A$  (on the right)

- A cocycle is a map  $\alpha : \Gamma \rightarrow A$ ,  $\alpha : \gamma \mapsto \alpha_\gamma$  s.t.

$$\alpha_{\sigma\tau} = (\alpha_\sigma)^\tau \cdot \alpha_\tau \quad \forall \sigma, \tau \in \Gamma$$

- $G$  is a reductive linear algebraic group defined over  $k$   
 $K$  is a Galois extension of  $k$

$$\Gamma := \text{Gal}(K : k) \quad A := \text{Aut}_K(G)$$

# Twisted Groups

- For a cocycle  $\alpha$ :

$$G_{\alpha}(k) = \{ g \in G(K) \mid g^{\gamma^{\alpha_{\gamma}}} = g \quad \forall \gamma \in \Gamma \} \leq G(K)$$

is a “twisted” group of Lie type

# Twisted Groups

- For a cocycle  $\alpha$ :

$$G_{\alpha}(k) = \{ g \in G(K) \mid g^{\gamma^{\alpha_{\gamma}}} = g \quad \forall \gamma \in \Gamma \} \leq G(K)$$

is a “twisted” group of Lie type

- “Untwisted” groups of Lie type given by the trivial cocycle:

$$G_1(k) = \{ g \in G(K) \mid g^{\gamma} = g \quad \forall \gamma \in \Gamma \} = G(k)$$

# Problem description

- Which elements are inside  $G_\alpha(k)$ ?
  - easy to decide for a given element
  - hard to find new elements

# Steinberg presentation and Root datum

- Consider the Steinberg presentation for  $G(k)$  with respect to
  - the root datum  $\mathcal{R} = (X, \Phi, Y, \Phi^*)$
  - and the fundamental system  $\Pi$

# Steinberg presentation and Root datum

- Consider the Steinberg presentation for  $G(k)$  with respect to
  - the root datum  $\mathcal{R} = (X, \Phi, Y, \Phi^*)$
  - and the fundamental system  $\Pi$
- Generators:  $x_r(t)$  with  $r \in \Phi$  and  $t \in k$

# Steinberg presentation and Root datum

- Consider the Steinberg presentation for  $G(k)$  with respect to
  - the root datum  $\mathcal{R} = (X, \Phi, Y, \Phi^*)$
  - and the fundamental system  $\Pi$
- Generators:  $x_r(t)$  with  $r \in \Phi$  and  $t \in k$
- Relations:

$$x_r(t)x_r(u) = x_r(t + u)$$

$$[x_r(t), x_s(u)] = \prod_{i,j>0} x_{ir+js}(C_{rsij}t^i u^j)$$

...

...

# $\Gamma$ -action on the root system

- Each  $\alpha_\gamma$  can be assumed to be of the form

$$\tau w h$$

- $\tau$  is Diagram automorphism
- $w$  is Weyl element
- $h$  is torus element

# $\Gamma$ -action on the root system

- Each  $\alpha_\gamma$  can be assumed to be of the form

$$\tau\dot{w}h$$

- $\Gamma$  acts on the root system  $\Phi$  by

$$\alpha_\gamma : r \mapsto r^{\tau w}$$

# $\Gamma$ -action on the root system

- Each  $\alpha_\gamma$  can be assumed to be of the form

$$\tau\dot{w}h$$

- $\Gamma$  acts on the root system  $\Phi$  by

$$\alpha_\gamma : r \mapsto r^{\tau w}$$

- Each orbit  $\mathcal{O}_\alpha(r)$  has one of the following properties:

$$\sum_{s \in \mathcal{O}_\alpha(r)} s = 0$$

$$\mathcal{O}_\alpha(r) \subseteq \Phi^+$$

# $\Gamma$ -action on the root system

- Each  $\alpha_\gamma$  can be assumed to be of the form

$$\tau\dot{w}h$$

- $\Gamma$  acts on the root system  $\Phi$  by

$$\alpha_\gamma : r \mapsto r^{\tau w}$$

- Each orbit  $\mathcal{O}_\alpha(r)$  has one of the following properties:

$$\sum_{s \in \mathcal{O}_\alpha(r)} s = 0$$

$$\mathcal{O}_\alpha(r) \subseteq \Phi^+, \quad \mathcal{O}_\alpha(r) \subseteq \Phi^-$$

# Relative root system

- Put

$$X_0 := \{ \chi \in X \mid \sum_{\gamma \in \Gamma} \chi^{\alpha_\gamma} = 0 \}$$

# Relative root system

- Put

$$X_0 := \{ \chi \in X \mid \sum_{\gamma \in \Gamma} \chi^{\alpha_\gamma} = 0 \}$$

- Let  $\bar{X} := X/X_0$  and  $\pi : X \rightarrow \bar{X}$
- $\pi$  is morphism of  $\mathbb{Z}$ -modules

# Relative root system

- Put

$$X_0 := \{ \chi \in X \mid \sum_{\gamma \in \Gamma} \chi^{\alpha_\gamma} = 0 \}$$

- Let  $\bar{X} := X/X_0$  and  $\pi : X \rightarrow \bar{X}$
- $\pi$  is morphism of  $\mathbb{Z}$ -modules
- $\Psi := \pi(\Phi \setminus \Phi_0)$  is a root system
- $\Delta := \pi(\Pi \setminus \Pi_0)$  is a fundamental system for  $\Psi$
- $\Psi$  not necessarily irreducible nor reduced (even if  $\Phi$  is)

# Relative root system

- Put

$$X_0 := \{ \chi \in X \mid \sum_{\gamma \in \Gamma} \chi^{\alpha_\gamma} = 0 \}$$

- Let  $\bar{X} := X/X_0$  and  $\pi : X \rightarrow \bar{X}$
- $\pi$  is morphism of  $\mathbb{Z}$ -modules
- $\Psi := \pi(\Phi \setminus \Phi_0)$  is a root system
- $\Delta := \pi(\Pi \setminus \Pi_0)$  is a fundamental system for  $\Psi$
- $\Psi$  not necessarily irreducible nor reduced (even if  $\Phi$  is)
- $\Psi$  is called relative root system

# Relative roots

- For a relative root  $\delta \in \Psi^+$  we have

$$\pi^{-1}(\delta) = \dot{\bigcup}_{r \in J_\delta} \mathcal{O}_\alpha(r) \subseteq \Phi^+ \setminus \Phi_0.$$

- Here  $J_\delta$  is a fixed set of representatives of involved orbits

# Relative root elements

- For a relative root  $\delta \in \Psi$  let
  - $V_\delta$  be the vector space over  $K$  with basis  $J_\delta$
  - write  $t = \sum_{r \in J_\delta} t_r r$

# Relative root elements

- For a relative root  $\delta \in \Psi$  let
  - $V_\delta$  be the vector space over  $K$  with basis  $J_\delta$
  - write  $t = \sum_{r \in J_\delta} t_r r$
  - For  $t \in V_\delta$  set

$$u_\delta(t) = \prod_{r \in J_\delta} \prod_{\gamma \in \Gamma} x_r(t_r)^{\gamma \alpha_\gamma}$$

# Relative root elements

- For a relative root  $\delta \in \Psi$  let
  - $V_\delta$  be the vector space over  $K$  with basis  $J_\delta$
  - write  $t = \sum_{r \in J_\delta} t_r r$
  - For  $t \in V_\delta$  set

$$u_\delta(t) = \prod_{r \in J_\delta} \prod_{\gamma \in \Gamma} x_r(t_r)^{\gamma \alpha_\gamma}$$

- Set

$$U_\delta = \{u_\delta(t) \mid t \in V_\delta\}$$

# Relative root elements

- For a relative root  $\delta \in \Psi$  let
  - $V_\delta$  be the vector space over  $K$  with basis  $J_\delta$
  - write  $t = \sum_{r \in J_\delta} t_r r$
  - For  $t \in V_\delta$  set

$$u_\delta(t) = \prod_{r \in J_\delta} \prod_{\gamma \in \Gamma} x_r(t_r)^{\gamma \alpha_\gamma}$$

- Set

$$U_\delta = \{u_\delta(t) \mid t \in V_\delta\}$$

- Two cases:

- $2\delta \notin \Psi$

- $2\delta \in \Psi$

# Relative root elements: Case $2\delta \notin \Psi$

- In this case root elements are

$$x_\delta(t) := u_\delta(t)$$

- The root subgroup is abelian group

$$X_\delta = U_\delta$$

# Relative root elements: Case $2\delta \in \Psi$

- The element  $u_\delta(t)$  is not fixed under  $\gamma\alpha_\gamma$

# Relative root elements: Case $2\delta \in \Psi$

- The element  $u_\delta(t)$  is not fixed under  $\gamma\alpha_\gamma$
- BUT: product of the same terms, in a different order

# Relative root elements: Case $2\delta \in \Psi$

- The element  $u_\delta(t)$  is not fixed under  $\gamma\alpha_\gamma$
- BUT: product of the same terms, in a different order
- obtain  $c(t)$  by reordering:

$$u_\delta(t)^{\gamma\alpha_\gamma} = u_\delta(t)c(t)$$

# Relative root elements: Case $2\delta \in \Psi$

- The element  $u_\delta(t)$  is not fixed under  $\gamma\alpha_\gamma$
- BUT: product of the same terms, in a different order
- obtain  $c(t)$  by reordering:

$$u_\delta(t)^{\gamma\alpha_\gamma} = u_\delta(t)c(t)$$

- $c(t)$  is product of root elements corresponding to roots in  $\pi^{-1}(2\delta)$

# Relative root elements: Case $2\delta \in \Psi$

- Need a correction term:  $v(t)$   
such that  $u_\delta(t)v(t)$  is fixed under  $\gamma\alpha_\gamma$

# Relative root elements: Case $2\delta \in \Psi$

- Need a correction term:  $v(t)$   
such that  $u_\delta(t)v(t)$  is fixed under  $\gamma\alpha_\gamma$

$$(u_\delta(t)v(t))^{\gamma\alpha_\gamma} = u_\delta(t)v(t) \iff c(t) = v(t)v(t)^{-\gamma\alpha_\gamma}$$

# Relative root elements: Case $2\delta \in \Psi$

- Need a correction term:  $v(t)$   
such that  $u_\delta(t)v(t)$  is fixed under  $\gamma\alpha_\gamma$

$$(u_\delta(t)v(t))^{\gamma\alpha_\gamma} = u_\delta(t)v(t) \iff c(t) = v(t)v(t)^{-\gamma\alpha_\gamma}$$

- This equation is solvable and the set of solutions in

$$X = \prod_{r \in \pi^{-1}(2\delta)} X_r$$

is the coset  $v(t)X_{2\delta}$  for any particular solution  $v(t)$

# Relative root elements: Case $2\delta \in \Psi$

- Need a correction term:  $v(t)$   
such that  $u_\delta(t)v(t)$  is fixed under  $\gamma\alpha_\gamma$

$$(u_\delta(t)v(t))^{\gamma\alpha_\gamma} = u_\delta(t)v(t) \iff c(t) = v(t)v(t)^{-\gamma\alpha_\gamma}$$

- This equation is solvable and the set of solutions in

$$X = \prod_{r \in \pi^{-1}(2\delta)} X_r$$

is the coset  $v(t)X_{2\delta}$  for any particular solution  $v(t)$

- Use modified version of additive Hilbert's Theorem 90

# Relative root elements: Case $2\delta \in \Psi$

- Relative root elements are

$$x_\delta(t) := u_\delta(t)v(t)$$

for a fixed solution  $v(t)$

# Relative root elements: Case $2\delta \in \Psi$

- Relative root elements are

$$x_\delta(t) := u_\delta(t)v(t)$$

for a fixed solution  $v(t)$

- Relative root subgroup is

$$\begin{aligned} X_\delta &:= \langle X_{2\delta}, \{x_\delta(t) | t \in V_\delta\} \rangle \\ &= \langle x_\delta(t) | t \in V_\delta \rangle X_{2\delta} \end{aligned}$$

# Relative root elements: Case $2\delta \in \Psi$

- Relative root elements are

$$x_\delta(t) := u_\delta(t)v(t)$$

for a fixed solution  $v(t)$

- Relative root subgroup is

$$\begin{aligned} X_\delta &:= \langle X_{2\delta}, \{x_\delta(t) | t \in V_\delta\} \rangle \\ &= \langle x_\delta(t) | t \in V_\delta \rangle X_{2\delta} \end{aligned}$$

- Note that the definition of  $X_\delta$  is independent of the choice of elements  $v(t)$

# Groups generated by relative roots

$$U_{\alpha}(k) = U(K) \cap G_{\alpha}(k) = \langle X_{\delta} \mid \delta \in \Psi^{+} \rangle$$

# Groups generated by relative roots

- 

$$U_{\alpha}(k) = U(K) \cap G_{\alpha}(k) = \langle X_{\delta} \mid \delta \in \Psi^{+} \rangle$$

- 

$$G_{\alpha}(k)^{\dagger} = \langle U_{\alpha}(k)^g \mid g \in G_{\alpha}(k) \rangle$$

# Groups generated by relative roots

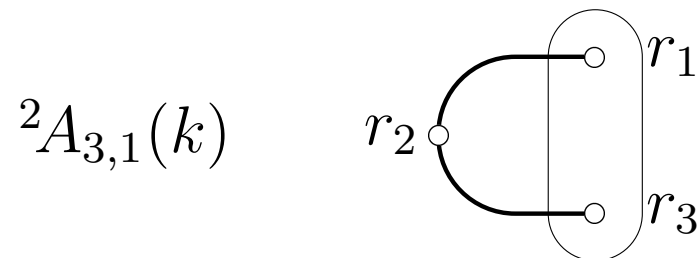

- 

$$U_{\alpha}(k) = U(K) \cap G_{\alpha}(k) = \langle X_{\delta} \mid \delta \in \Psi^{+} \rangle$$

- 

$$\begin{aligned} G_{\alpha}(k)^{\dagger} &= \langle U_{\alpha}(k)^g \mid g \in G_{\alpha}(k) \rangle \\ &= \langle X_{\delta} \mid \delta \in \Psi \rangle \end{aligned}$$

# Example

$$\mathcal{O}_\alpha(r_1) = \{r_1, r_2 + r_3\}$$

$$\mathcal{O}_\alpha(r_2) = \{r_2, -r_2\}$$

$$\mathcal{O}_\alpha(r_3) = \{r_3, r_1 + r_2\}$$

$$\mathcal{O}_\alpha(r_*) = \{r_*\}$$
